

ABSTRACT OF THE DISCLOSURE

A method and its system for acquiring object reference information from a naming service. When executing an object, a retrieval request, which includes the object name of the object, is sent to a computer for providing the naming service. Next, the object is executed on the basis of object reference information acquired as the response to this retrieval request. Moreover, when executing the object, it is judged whether or not the object reference information on the object has been stored in a reference-information storage area into which the acquired object reference information is stored. Furthermore, if the object reference information has been stored therein, an execution request is sent which is implemented for executing the object on the basis of the stored object reference information.
